

Correspondence: Canvas Mapping to Graph/Paper

Source feature: Canvas Mapping
Target feature(s): Graph, Paper
Automation type: OperatorHelp - MIX
Relation: Canvas Mapping in GMF defines the diagram-level entry point, combining both the semantic root of the diagram and its global visual configuration. In JointJS, these responsibilities are intentionally separated: Graph manages the diagram's underlying model, while Paper manages rendering, layout, and interaction. Therefore, a single Canvas Mapping can be realized by coordinating Graph and Paper, making the correspondence valid despite the structural decomposition.
Operators: Mr. X

Main Strategy:

- 1. [A] take the element property (A) of the canvas mapping
- 2. [A] create one JavaScript file (name it A.js) with instantiating Graph and Paper, and another JavaScript file (name it A+Elements.js)
- 3. [A] supervisors should set the desired Paper's properties such as width, height, drawGrid, gridSize, binding to the HTML element, etc.

Structural overview
