

Correspondence: Feature Label Mapping to Dia Visual Properties

Source feature: Feature Label Mapping
Target feature(s): tagName, selector, object of attrs
Automation type: FullAutomation - EASY
Relation: A GMF Feature Label Mapping specifies which feature is displayed and associates it with a label figure. In JointJS, the same intent is realized by introducing a text sub-element in the element's markup (tagName/selector) and assigning its visual and textual configuration through attrs.

Main Strategy:

1. [A] take the feature to display (A) property of Feature Label Mapping
2. [A] take the node mapping parent (B) of Feature Label Mapping
3. [A] take B's Dia Element equivalent (C)
4. [A] add an object to Visual Structure of C with the tagName and selector being 'text' and 'A+Label'
5. [A] add an object to attrs of Visual Attributes of C with the name being 'A+Label'

Structural overview
