

Correspondence: Canvas Mapping to Diagram Description

Source feature: Canvas Mapping
Target feature(s): Diagram Description
Automation type: FullAutomation - EASY
Relation: Canvas Mapping in GMF and Diagram Description in Sirius both act as the entry point of a graphical editor, defining the semantic root of the diagram and its global configuration. While the concrete mechanisms differ, their roles in establishing the diagram context are conceptually equivalent. Canvas Mapping specifies how a domain model element becomes the diagram canvas, while Diagram Description declares the diagram's root semantic element and overall behavior.

Main Strategy:

- 1. [A] create a description diagram with a default layer

Strategies of subcorrespondences

Computing Domain Class

- 1. [A] copy value of Element and paste into domain class

Structural overview
