

Correspondence: Shape Resemblance

Source feature: Shape
Target feature(s): Style
Automation type: OperatorHelp - MIX
Relation: Both GMF Shapes and Sirius Styles are responsible for determining how a diagram element is visually rendered. While GMF provides explicit shape primitives, Siri us abstracts geometric form into style configurations, making Style the closest construct capable of preserving the visual intent expressed by a GMF Shape.

- Main Strategy:**
- 1. [M] supervisors should identify the Sirius equivalent feature (A) for which this shape feature draws a figure in a GMF mapping
 - 2. [M] supervisors should check if the shape draws a basic shape e.g. rectangle, triangle, circle etc. (X)
 - 3. [-] if X is true
 - 3.1. [A] create a basic style for A (Square, Diamond, Ellipse, Parallelogram etc. based on the highest similarity and availability)
 - 4. [-] else
 - 4.1. [M] supervisors should create an image (B) visually matching what the shape describes in the svg, jpg, png, etc. format
 - 4.2. [A] take the path (C) of the image
 - 4.3. [A] create a Workspace Image (D) for A
 - 4.4. [A] paste C into the image path property of D

Structural overview
