

Correspondence: Computing Children Presentation for Container Mapping from Top Node/Child Reference

Source feature: LayoutData
Target feature(s): Children Presentation
Automation type: OperatorOffHelp - MIX
Relation: Although GMF and Sirius rely on fundamentally different layout paradigms - absolute positioning versus declarative layout policies - both mechanisms ultimately aim to control how child elements are visually organized within a container. Chi Idren Presentation in Sirius represents the closest abstraction capable of preserving the directional and sequential intent encoded implicitly in GMF layout data.
Operators: Mrs. Z, Mr. X

Main Strategy:

- 1. [A] check if LayoutData features are all a kind of XYLayoutData (Z)
- 2. [-] if Z is true
 - 2.1. [A] check if all the x properties of L is increasing but the y remained unchanged (W)
 - 2.2. [-] if W is true
 - 2.2.1. [A] child presentation is horizontal stack
- 2.3. [A] else check if all the y properties of L are increasing but the x remained unchanged (Q)
- 2.4. [-] if Q is true
 - 2.4.1. [A] child presentation is vertical stack
- 2.5. [A] supervisors should decide a desired option
- 3. [-] else
 - 3.1. [M] supervisors should decide a desired option

Structural overview
